

RAYNOK HC-101B COMMISSIONING PENDANT

PRODUCT DESCRIPTION:

The Raynok HC-101B is a localized operator control pendant that is used for commissioning, maintenance and technical support activities.

The device bypasses all software controlled limits but respects all end-of-travel and over-travel limits. Momentary bypass switches allow the operator to drive off overtravel limits or through end-of-travel limits.

Common uses of the pendant include, cable spooling, limit testing, setup, commissioning and general maintenance.

The E-Stop button acts as a Machine Stop, stopping only the machine it is connected to. The reset button resets faults as well as the global E-Stop system.

When connected to a machine drive or starter operation from the console is disabled.
